August 4, 2020

Rigel Kent Security, an industry leading IT security company, and its founder, Mike Sues, have a long history in the Cybersecurity & Intelligence community, with the founder's involvement dating back to 1987. We have been and continue to specialize in Offensive Operations, both emulating attacker's capabilities during Cyber Exercises as well as executing operations during Red Team engagements. We bring this expertise of understanding attacks and their tactics to our Penetration Testing services, whether they are against Products, Networks, Web Applications, ICS, IoT or Mobile Applications.

For March Networks in July of 2020 Rigel Kent Security conducted an analysis of the following March Networks Digital Video Recorders,

8000 Recorder Series
9000 Recorder Series
RideSafe Recorder Series

for the presence of any unusual IP-based network communications from the device to vendor networks/sites/services in China, including but not limited to whether the equipment could route or redirect user data traffic or permit visibility into any user data or packets that such equipment transmits or otherwise handles.

Rigel Kent Security collected and analyzed traffic during recorder startup, shutdown as well as normal operation, and detected no IP-based direct or indirect network communications, nor any routing or redirecting of data traffic, that could be used to permit visibility into user data, exfiltrate data, metadata or infer any data from any of the tested recorders.

Thank you,

Mike Sues
